首先到网上随意找介绍,熟悉概念,发现简单例子,但还是想全面了解,于是找Apple的例子,到【<u>https://developer.apple.com/library/ios/samplecode/GenericKeychain/Introduction/Intro.html</u>】下载。打开工程,看Readme文件。有这么一段描述: The sample must be edited to include your app ID prefix in five places where the text "YOUR_APP_ID_HERE" appears before building and running the sample apps. The easiest way to do that is to use Xcode's Find in Project command to locate the places that must be edited first. Just change the app ID prefix; leave the rest unchanged.

意思是要用app的ID prefix去替换YOUR_APP_ID_HERE这个字符串,一开始以为是Apple ID,提示Provision file不匹配。看网上例子是一串字符,以为是这个: ▶ 📴 iPhone Developer: xiang ding (99UZ5H9UX9)

iPhone Developer: yx113355@qq.com (QNLJG5K7D7) 括号里这串。也提示不匹配。

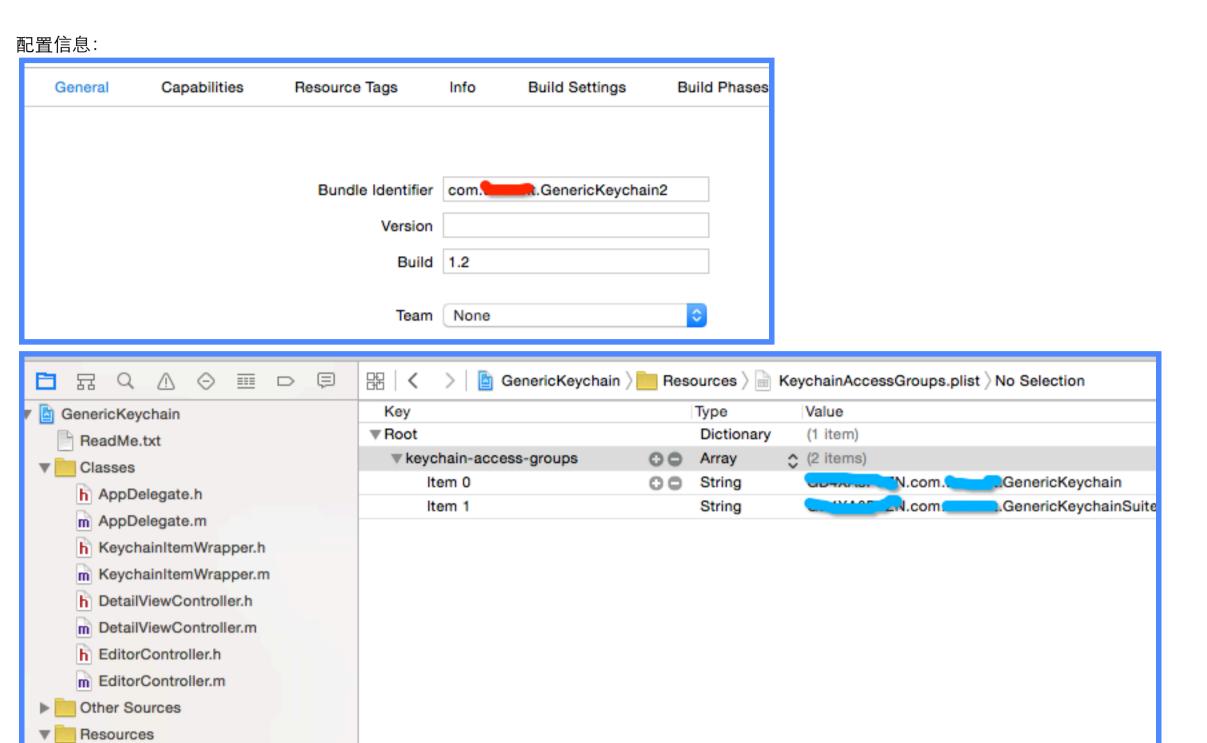

经同事提醒是app ID prefix。用这个: iPhone Developer: (-----) iPhone De 签发者: Apple Worldwide Developer Relations Certification Authority 过期: 2016年5月25日 星期三 中国标准时间17:40:25 Certificati ☑ 此证书有效 签发者: Apple Worldwide Developer Relations Certification Authorit 过期: 2016年5月25日 星期三 中国标准时间17:40:25 必 此证书有效 ^ 种类 Apple Application Integration Certification Authority ▶ 信任 证书 Apple iPhone Certification Authority 证书 ▼ 细节 Apple iPhone OS Provisioning Profile Signing 证书 Apple Root Certificate Authority 证书 用户 ID K4G54VEB74 Som.apple.idms.appleid.prd.326c374 证书 ▶ 🔄 iPhone Developer: ((1) 证书 组织单位 GD ▶ 🔄 iPhone Developer: _____@qq.com (_____) 证书 组织 _____ 国家/地区 US

组织单位的字符串。(也可以命令行查看到: 【 security cms -D -i /Users/myusername/my.mobileprovision 】)

app ID prefix到底是什么,哪里可以看到? 其实在开发者中心创建app id时有提示: https://developer.apple.com/account/ios/identifiers/bundle/bundleCreate.action Certificates All Pending Registering an App ID Development Production Identifiers App IDs The App ID string contains two parts separated by a period (.)—an App ID Prefix that is defined as your Team ID by default and an App ID Suffix that is defined as a Bundle ID search string. Pass Type IDs Each part of an App ID has different and important uses for your app. Learn More Website Push IDs iCloud Containers App Groups App ID Description Merchant IDs Name: Devices You cannot use special characters such as @, &, *, ', " All Apple TV App ID Prefix Apple Watch iPad Value: (Team ID) iPhone iPod Touch App ID Suffix Provisioning Profiles

也就是Team ID.

知道这个就一切简单了。

wrapper = [[KeychainItemWrapper alloc] initWithIdentifier:@"Account Number" accessGroup:@" .GenericKeychainSuite"]; .com.

Keychain Access

运行时还有一个编译错误是因为我用的xcode7, bitcode配置默认是YES,而这份代码非常早了,把这个改为NO。

那不付费的开发证书可以吗? 可以

Info.plist Info2.plist

Default.png Default2.png

images ▶ Frameworks

▶ Products

KeychainAccessGroups.plist

MainWindow.xib

MainWindow2.xib Localizable.strings

KeychainAccessGroups2.plist

代码理解: 一、查询

1、类型: kSecClass -安全项的类别

系统定义了这几种: extern const CFStringRef kSecClassGenericPassword __OSX_AVAILABLE_STARTING(__MAC_10_7, __IPHONE_2_0); extern const CFStringRef kSecClassInternetPassword __OSX_AVAILABLE_STARTING(__MAC_10_6, __IPHONE_2_0); extern const CFStringRef kSecClassCertificate __OSX_AVAILABLE_STARTING(__MAC_10_7, __IPHONE_2_0); extern const CFStringRef kSecClassKey __OSX_AVAILABLE_STARTING(__MAC_10_7, __IPHONE_2_0); extern const CFStringRef kSecClassIdentity __OSX_AVAILABLE_STARTING(__MAC_10_7, __IPHONE_2_0); 其实可以参考mac上的钥匙串来理解

                                                                                                                                    private key
                                                                                                                                                                                                                                                      login
                                                                               iMessage Signing Key
                                                                                                                                    public key
                                                                                                                                                                                                                                                       login
eg: [genericPasswordQuery setObject:(id)kSecClassGenericPassword forKey:(id)kSecClass];
```

```
2、属性
SecItem.h中定义了每种类型支持的属性,如:
    @enum Attribute Key Constants
    @discussion Predefined item attribute keys used to get or set values in
        dictionary. Not all attributes apply to each item class. The table
        below lists the currently defined attributes for each item class:
    kSecClassGenericPassword item attributes:
        kSecAttrAccessible
        kSecAttrAccessControl
        kSecAttrAccessGroup
        kSecAttrCreationDate
        kSecAttrModificationDate
        kSecAttrDescription
        kSecAttrComment
        kSecAttrCreator
        kSecAttrType
        kSecAttrLabel
        kSecAttrIsInvisible
        kSecAttrIsNegative
        kSecAttrAccount
        kSecAttrService
        kSecAttrGeneric
        kSecAttrSynchronizable
```

eg: [genericPasswordQuery setObject:identifier forKey:(id)kSecAttrGeneric]; 如果用了Group,加上这个属性: [genericPasswordQuery setObject:accessGroup forKey:(id)kSecAttrAccessGroup]; accessGroup就是多个App中用来标识共享数据的唯一id,以你的带前缀的app id开头且要设定到工程设置的code signing entitlements文件中。

3、数据匹配策略: kSecMatchPolicy系统定义了很多匹配策略,可以根据需要选取

[genericPasswordQuery setObject:(id)kSecMatchLimitOne forKey:(id)kSecMatchLimit];

4、返回数据的类型: kSecReturnData 有这几种:

extern const CFStringRef kSecReturnData __OSX_AVAILABLE_STARTING(__MAC_10_6, __IPHONE_2_0); extern const CFStringRef kSecReturnAttributes __OSX_AVAILABLE_STARTING(__MAC_10_6, __IPHONE_2_0); extern const CFStringRef kSecReturnRef __OSX_AVAILABLE_STARTING(__MAC_10_6, __IPHONE_2_0); extern const CFStringRef kSecReturnPersistentRef __OSX_AVAILABLE_STARTING(__MAC_10_6, __IPHONE_2_0);

eg: [genericPasswordQuery setObject:(id)kCFBooleanTrue forKey:(id)kSecReturnAttributes];

5、执行查询

根据设定的返回类型,用合适的变量去接收数据 NSDictionary *tempQuery = [NSDictionary dictionaryWithDictionary:genericPasswordQuery];

NSMutableDictionary *outDictionary = nil; if (! SecItemCopyMatching((CFDictionaryRef)tempQuery, (CFTypeRef *)&outDictionary) == noErr)

6、从返回结果中取数据

设定要取的数据类型和类别 // Add the proper search key and class attribute. [returnDictionary setObject:(id)kCFBooleanTrue forKey:(id)kSecReturnData];

[returnDictionary setObject:(id)kSecClassGenericPassword forKey:(id)kSecClass];

// Acquire the password data from the attributes. NSData *passwordData = NULL;

if (SecItemCopyMatching((CFDictionaryRef)returnDictionary, (CFTypeRef *)&passwordData) == noErr)

junk = SecItemDelete((CFDictionaryRef)tempDictionary);

二、增加和更新数据

用 SecItemCopyMatching检查是否存在,不存在就调用SecItemAdd添加,否则用 SecItemUpdate更新。 对于更新的第二个参数有这样的要求: Only real keychain attributes are permitted in this dictionary (no "meta" attributes are allowed.)

所以例子里把kSecClass移除了: [tempCheck removeObjectForKey:(id)kSecClass];

三、删除数据

调用 SecItemDelete<mark>就行:</mark> NSMutableDictionary *tempDictionary = [self dictionaryToSecItemFormat:keychainItemData];
